Assignment 5

1) What is axios?

Axios is a library that serves to create HTTP requests that are provided externally.

2) What is pure Component? How to make class & functional component as pure Component.

Pure Components are the components which donot re-renders when the value of state & props has been updated with the same value.

For pure class, React provides the Pure Component base class. Class components that extend the React Pure Component class are treated as Pure Component.

3) Which is the dev server used in React Project?

Webpack-dev-server

4) what is axios interceptors?

They are the default configurations that are added automatically to every request or response that a user recieves it is useful to check response status code for every response i.e being recieved.

5) What is Fragment?

A common pattern in React is for a component to return multiple elements. Fragments let you group a list of childrens without adding extra nodes to the DOM.
